- ArchiMate is Enterprise Architecture modeling language.
- It offers an integrated architectural approach that describes and visualizes different architecture domains and their underlying relations and dependencies.

What is ArchiMate?

(2/2)

- It provides a uniform representation for diagrams that describe Enterprise Architectures.
- The ArchiMate ecosystem supports an exchange format in XML which allows model and diagram exchange between tools.
- There are no formal semantics assigned to colors and the use of color is left to the modeler.
- Other notational cues can be used to distinguish between the layers of the framework. A letter M, S, B, A, T, P, or I in the top-left corner of an element can be used to denote a Motivation, Strategy, Business, Application, Technology, Physical, or Implementation & Migration element, respectively.

Relationship with TOGAF

The TOGAF and ArchiMate standards can easily be used in conjunction:

- The two standards complement each other with respect to the definition of an architecture development process and the definition of an Enterprise Architecture modeling language
- The two standards overlap in their use of viewpoints, and the concept of an underlying common repository of architectural artifacts and models; i.e., they have a firm common foundation
- The combined use of the two standards can support a better communication with stakeholders
